

Internet-GIS WS22/23: Exercise 1

Task 1:

Given is an image of the world (projection unknown!). You can find the image in the StudIP folder “**Exercise 1**” (see below).

Create an HTML page (using a text editor of your choice) including an HTML 5 header, section, and footer

- The header should contain the title of the web page
- The footer should contain information related to the web page (author name, matriculation number, contact information (e.g., hyperlink to e-mail), copyright, etc.)
- The section part should contain a paragraph containing a textual description of what is displayed on the page as well as the given world map (e.g., half the original size, with hyperlink to Wikipedia article)

Open the file with the different browsers available and check the differences in display

Task 2:

Develop a proper layout for the created HTML above, e.g., by:

- Setting a nice background color for the header and footer
- Centralizing the header and footer text
- Align the text and the image horizontally (text left, image right)
- Set the image size relative to the parent element (by maintaining the proper aspect ratio.)

Task 3:

Add an image map to the map, in order to make the continents clickable:

- Use boxes or non-overlapping polygons
- Add proper hyperlinks to the image parts, e.g. pointing to Wikipedia articles on the continents

Please upload your results to your group folder in StudIP by 25.10.2022. Please create a new subfolder for each exercise. If you have implemented all the components into task 3 (including task 1 and task 2), you only need to submit task 3.
